Raman peaks are not clear. Author need to show D, G 2D band. Follow this below manuscript.

“Raman spectrum of graphene with its versatile future perspectives” – completed in the text on the page 4

AFM images require for both monolayer and trilayer graphene - We wasn’t able to do AFM images. Our graphene samples was too large to show the difference between mono and trilayer graphene on one AFM image. We haven’t been able to find the region where we could observe substrate, monolayer graphene and thrilayer. However, to prove presence of trilayer graphene we attached figure with the 2D band fitting(supplementary information Figure S2)

Figures are not clear. Author should provide very clear image. Images are very poor, it is difficult to go through it. – the quality of figures was improved
