Point by Point Response

Avian Influenza: Strategies to manage an outbreak.

Reviewer #1: Simancas-Racines et al. reported avian influenza with particular attention to the strategies to manage outbreaks. The review is very interesting and well-organized. However, I recommend adding a chapter about vaccination.

Thank you for your comments and guidance. We have added a chapter about vaccination in section 6.

Other minor revision:

- Family and orders should be in italics (Orthomyxoviridae (line 94), Anseriformes, and Charadriiformes (line 187)).

  We agree with the reviewer; hence, we have modified it.

- Line 119: Low pathogenic avian influenza virus should be LPAI

  We agree with the reviewer; hence, we have modified it.

- Line 132: highly pathogenic influenza should HPAI

  We agree with the reviewer; hence, we have modified it.

- Line 98: Please describe the virus. " The segmented nature of the influenza virus genome leads to emerging of new viruses through genetic reassortment, making its prevention and control more difficult (Parvin et al. 2022; Doi: https://doi.org/10.51585/gjm.2022.3.0016).

  We agree with the reviewer; hence, we have modified it.
