Revision Manuscript jcm-1566210

Reviewer 2

Strength: This study focused on the role of modifiable factors (physical performance) and patients' compliance in ARVC progression, and it results are in accordance with existing data and recommendations.

Minor suggestion: Spectrum of genetic findings in ARVC patients (genes, variants, class of pathogenicity), and genotype-phenotype correlations (if any) would increase the scientific value of the study.

Author: We thank the reviewer for this important suggestion. We have added a descriptive analysis to the revised paragraph “Study Population”. Unfortunately, due to the small sample size we were unable to run a robust multivariable statistical analysis, which would be necessary to assess possible genotype-phenotype associations and its impact on disease progression.
