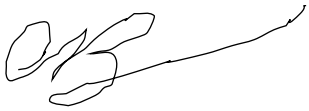
Dear Editorial Board:

Thank you in advance for your and the editorial board's consideration of article "*A Contemporary Review of Robotic Resection for Hepatocellular Carcinoma"* . We have responded to the inquiry of the editor with a revised(highlighted) manuscript.

This study was well-written and full of information. More information about robotic hepatectomy margins, metabolic syndrome, huge HCCs, and comparson with microwave ablation were reported that made the paper interesting.
But the maniulation of energy device could be put in the discussion, such as vessel extend and Synchroseal, Harmonic Scalpel , lack of CUSA and dual bipolart tchnique. The concept of bedside and console surgeon is another important issue for safety and effective practice.

We have revised the manuscript with a paragraph in the discussion looking at energy and surgical tools. This is highlighted in the revised version.

Best,



Adam S. Bodzin, MD
