Relationship between average wages and the economic indicators of the manufacturing sector in the region of V4 countries #Review Report

The aim of this paper was to examines whether selected economic indicators of the manufacturing sector in the region of the V4 countries affect its level of average wages. Wages represent a key determinant of the attractiveness, but also the potential to increase the standards of living and the long-term sustainability of the sector. The selected economic indicators for the period 2008-2019 in relation to average wages were: FDI Flow, GDP, labour productivity, employment, number of hours worked in the manufacturing sector. The secondary data, which served as a basis for the study, came from the OECD database.

1. This is a well-organized manuscript.
2. The research questions are valid.
3. The introduction is theory based, **but it's lack sufficient information about the previous study findings is presented for readers to follow the present study rationale and procedures.**
4. A multiple regression model was used and adequately tested.
5. The suitability of the proposed model was adequately tested using the ANOVA method.
6. **Figures and tables don't accurately represent the results, but they have to be presented more accurate and adequate.**
7. The language is clear and understandable.
