Re: Manuscript entitled "**Leclercia Adecarboxylata in Peritoneal Dialysis Patients: A Systematic Review**",

Dear editor,

On behalf of my co-authors I thank you for your letter regarding our above mentioned manuscript containing the comments of the reviewers. Based on the recommendations of the reviewers we have modified the manuscript and we now submit the revised manuscript. Our responses point-by-point are shown below:

Reviewer's 3 comments

Q: The study included only 13 cases of peritonitis due to L. adecarboxylata, which may not be sufficient to draw definitive conclusions or make generalizations about the management of this condition. This should be mentioned in the discussion.
A: We totally agree with your comment and although we have already a paragraph about the limitations of our study, we have add a sentence based on your recommendation in the last paragraph of the discussion in the revised ms.

Q: The study relied on published case reports, which may not reflect the true incidence or prevalence of peritonitis due to L. adecarboxylata. It is possible that cases with unfavorable outcomes were not reported or were not published in the languages searched in this study.
A: We would like to thank you for your comment and we have add a sentence based on your recommendation in the last paragraph of the discussion in the revised ms.

Q: Since this is a case series study, there is no comparison group to evaluate the effectiveness of the treatment strategies used in this study. Therefore, it is difficult to determine if the outcomes were solely due to the treatment provided or other factors.
A: We have add a sentence based on your recommendation in the last paragraph of the discussion in the revised ms.

Q: The study did not perform any statistical analysis to evaluate the significance of the findings. Therefore, it is unclear if the treatment strategies used were effective or if the outcomes were simply due to chance.
A: We have add a sentence based on your recommendation in the last paragraph of the discussion in the revised ms.

On behalf of all authors,

Sincerely,

John Dotis, MD, MSc, PhD
