„Assessment of Green Banking Performance"

Thanks to the Authors and Editors of the Journal of Sustainability for the opportunity to read and review the manuscript of 'Assessment of Green Banking Performance'.

I suggest a few changes. I provide more details below, which can hopefully of guidance to the Authors. I wish them good luck with their work. I wish them good luck with their work.

Our suggestions:

- Methodology – It is not clear why the method is appropriate. I would prefer if the Authors use some alternative methodology for a robustness check (for example, Hellwig method).
- Methodology – it is a pity that the authors did not use the Delphi method in their study,,
- Methodology – The choice of weights is a crucial element of the research. The weights selection needed to be added to the discussion.

  Linear ordering methods require definitions of quantitative weights for the attributes. Numerous methods have been suggested in the MCDM literature to determine the weights of diagnostic variables.
- Results – – is it justified to provide all calculations in the TOPSIS method? Isn't the final ranking enough?
- Discussion – no discussion of the results obtained. They should be compared with previous research..

Hope this suggestions may help Authors to improve their work.
