Reviewer comments

The paper titled," **Research progress and challenges in laser controlled cleaning of aluminium alloy substrates",** discusses about the literature review based on laser cleaning of aluminium alloy. I studied this paper carefully. Following are my comments:

1. Abstract should be revised and it is suggested to remove the word "we".
2. This paper have lots of grammatical mistakes. These should be corrected.
3. Authors have written many places like surface's roughness, beam's power, substrates's surface……etc. This way of writing should be avoided.
4. Aluminium is highly reflecting material. Justify the application of laser cleaning of aluminium alloy.
5. Mention the optimum power range and laser fluence used in laser cleaning of aluminium alloy.
6. Section 4.3 and section 4.4 are repeated, "Adhesive performance".
7. Conclusion parts need revision. It should be more precise.

Overall this paper is not suitable for publication in present form.
