Reply to the Reviewer 2

This is a review article which describes the role of a cosmetic ingredient as antiinflamatory. Understanding the response of keratinocytes to moisture is key in therapeutics to prevent oxidation, inflammation and ageing of the skin. The authors have clearly described the activation routes involved in this process, but also the antioxidative properties. Overall, the information reported in this review is useful. However, the only thing I'm missing is where the figures have been obtained. Did the authors take those images? Were they taken from the literature? If so, please reference accordingly.

→ Thank you very much for your encouraging comments. The figures are our original pictures which we re-obtained by our experiments in order to facilitate or smoothen the readers' understandings. Of course, the content of all figures were already published using different figures and the references were suitably cited in appropriate sentences in the text. For example, the similar results as Figure 1 were published in reference 55 (line 120-123).

Thank you very much again for your valuable review. We hope the revised article is now suitable for publication in JCM.

To the Reviewer 3

The work entitled "**Galactomyces ferment filtrate, an antioxidative AHR-modulating cosmetic ingredient, might potentiate an antiinflammaging system in keratinocytes**" (**jcm-1946202**) has been designed and conducted well, with a remarkable conclusion.

However, the authors should address some issues before considering the manuscript for publication (minor revision).

The manuscript should be revised for linguistic, grammatical, word spacing, and style errors. The format of the whole manuscript and the reference style must comply with the guidelines of the Journal.
