Dear authors,

General Observations

It is important to completely review all references, checking those in the text with those in the references item. Take advantage and review the reference [48], it has an enter in the middle of the article title.

How do authors define a geosite?

What is the best way for a place of geological-geomorphological interest to be considered a geosite or not?

I believe it is important to be mentioned in the introduction of the article.

The main observations follow below.

line observations

Introduction / Page 01 / Line 20 = Take advantage and review the reference [48], it has an enter in the middle of the article title.
Introduction / Page 02 / Line 06 = After reference [54] it is important to mention the article by “Fuertes-Gutiérrez & Fernández-Martínez 2010 - Geosites Inventory in the Leon Province (Northwestern Spain): a Tool to Introduce Geoheritage” which brings the proposal of classifying Geosites in five typological categories: point, section, area, complex area, and viewpoint.
Geosites selection and assessment / Page 06 / last paragraph = What led you to define these places and articles? It is noted that different qualitative and quantitative methodologies were applied in them.
Conclusions / Page 09 = For an article with many citations and with excellent results and comparisons between different geosites, I believe it could have a more detailed conclusion. For example, take the time to answer the questions above.

Thanks
