The authors addressed an extremely interesting, current topic, which discusses the sector of breeding pigeons for meat, its problems, and a possible solution.

Were the pigeons in the study artificially infected? To what extent the experiment can be extrapolated to naturally infected pigeons? Through the results of this study, can the economic impact be estimated in the sector of breeding pigeons for meat from the authors' point of view?

This aspect should be highlighted.

From the analysis of the manuscript, I recommend publication after minor revision.
