

The work "Utilizing Remote Sensing to Quantify Performance of Soybean Insecticide Seed Treatments" uses unmanned aerial vehicle image analysis to compare the performance of different soybean insecticide seed treatments in locations with low or high bean leaf beetle feeding pressure.

The authors do an excellent job of presenting their findings. The methodology is well-described and appropriate. Results are presented understandably and discussed well in the context of other research on related topics. My comments and suggested changes are relatively minor and are generally related to improving the reader's understanding of this work:

- 1) To cite bibliographic references, use [1-4] on line 33 and [7-13] on line 38. So on and so forth.
- 2) In Materials and Methods: It would be interesting to add a map with the field trials' locations.
- 3) In Materials and Methods: At the end of this section, I would like to see a new figure about the study flowchart.
- 4) References 20, 44, and 58 appear to be written in a different font.
