

REVIWER 2

Introduction

Background to the topic has been well-described. Research gap has been highlighted.

Research aim is not representing the main aim of the paper (Line 103-104).

The objective has been modified to comply with the character of exploratory research (Line 113-115)

“The purpose of the current study is to ascertain the risk of developing general ED, AN, and BN as well as to examine the effects of sex, housing location, academic year, faculty, and dietary quality on that risk”.

Research hypothesis should be presented in paragraph format, avoiding bullets.

The assumptions have been rewritten in one paragraph

Some degree of improvement is required with regard to the language used.

We have sent the article for language revision to improve the language used.

Materials and methods

2.1 - should be "Study design"

We have made a typo. We have changed it to study design.

2.1 - the study design should be elaborated further here

We have further developed the explanation of the study design.

Line 176 - is the bold sentence a section header?

We wanted to highlight in bold the phases of the data collection:

1. Administration of an online questionnaire

2. Performance of anthropometric measurements

Line 184 - .. body mass index classification.

We have included the word “classification”.

Line 189 - BMI was distributed using the WHO range classification is redundant

This sentence was deleted so as not to be redundant as it was included in the previous paragraph.

Results

It is unclear why the authors did not consider logistic regression analysis analyzing the factors against AN, BN and general EDs, respectively.

Because most of the variables are categorical, it has been decided to include OR and CI. This allows us to establish risk or protective relationships between the variables that have been analyzed. Furthermore, the p-value is included to verify or exclude the significance of the connection between variables; p-values less than 0.05 are regarded as significant.

Lot of emphasis on sex when it comes to data presentation, and the reason behind this is not clear.

In Table 1, we have decided to present the data divided according to sex to better categorize the different study groups. In Table 2, we have decided to present the data divided according to sex because there are differences in body composition between males and females. It should be mentioned that, among the characteristics, gender has been found to have a greater correlation with the chance of having ED.

Discussion & Conclusions

There seems to be confusion in the separation between the discussion and the conclusion.

In transcribing the article into the journal template, part of the discussion was copied into the conclusions section. This has been corrected.

Overall

Check the journal's formatting guidelines.

We have changed and adapted the format of the headings and tables to the format requested.

There is a need to recheck the manuscript for language consistency before resubmission.

We have submitted the article for language revision.
