Comments and Suggestions for Authors

Thank you for the opportunity to read your paper.

Some comments/suggestions:

- Please development the idea: "The adopted different education models (intensive foreign language, physical sciences or social sciences programs)", and the relation with "The research population consists of all Imam Hatip Schools (or Religious Vocational High Schools)";

Different educational models discussed and additional chapter provided in 1.5 as like:

1.5. Program Diversity and Sustainability Studies in Project Schools

Program Diversity is implemented in project schools to enable students to develop themselves in a field of their choice. With the variety of programs, students are encouraged to develop themselves by studying more intensively in the fields of science, social sciences, foreign language. Other high schools provide education for 4 years while project schools offer 5 years of education [58]. In the schools that implement the Language Project, one of the languages of English, German, Spanish, Russian and Arabic is taught as the first foreign language and the other as the second foreign language. During the training period, the students are sent to the countries where the language they have learned are educated. Kartal Anatolian Imam Hatip High School, one of project the
schools, in terms of the number of students IGCSE in school is Turkey's largest and also most successful public school. Its IGCSE success in the last three years is 98.2% [58].

In addition to the courses taught at the school, students of science and social sciences project schools receive academic support from universities. Two scientific workshops are held every week and one conference is held each month by academicians in the project school. Apart from the course materials, students read at least 4 books a year about their field and negotiate with their teachers. Students conduct scientific studies, experiments, examinations, travel and observations. The Project School model encourages students to learn through experience and produce more. That is to say, project schools are a new model for sustainable development. Because students attended regularly in different fields' projects such as physics, chemistry, biology, ecology, history, geography organized by Scientific and Technological Research Council of Turkey (TUBITAK). The number of scientific projects in the last five years has increased more than three times [58]. Figure 2 shows the increase in the number of scientific projects in the last 5 years from the year the project schools were established:

- I disagree with: "Sustainability is regarded as the ability to carry on under certain conditions, maintain the existing situation and continuance. (Becker, 2012)";

We agree with your comment and removed the reference by (Becker, 2012). We added new references explaining the sustainability concept broader.

- rewrite all the text for typos and a better readability;

Nearly all text is rewritten and typo errors are corrected. You can check it from the track changes part of the Microsoft Word as well.

- it seems necessary an updated of the references in for a better justification of the relation about "Sustainable Development and Organizational Sustainability.";

The relationship between organizational commitment and organizational sustainability is supported with the updated references

- the results are fine and clear;

- in my opinion, it's necessary a more robust justification about institutional/organizational sustainability, and the relation between org. sustainability and organizational commitment.

The relationship between organizational commitment and organizational sustainability is supported with the given references and also introduction is rewritten inline with that. Furthermore, discussion part is added for better understanding.
