GENERAL CONSIDERATIONS OF THE AUTHORS

We greatly appreciate the close readings of the four Reviewers and their pertinent comments that have been used to revise and improve the text. Below we reply in detail to the Reviewers’ concerns: Reviewers’ comments are written in italic and our replies follow in plain text. Changes in the revised manuscript are also highlighted in yellow.

REVIEWER #1

General considerations

*Comparing real movements and virtual-reality ones of humans is valuable to enable virtual-reality rehabilitation/training methods for muscle recovery, as described by authors. This work specifically investigates and proves the similarity between real and virtual-reality throwing movements. The experiment design, data processing/organization, and manuscript content organization are reasonable to show the conclusion. I think that this work can be considered for publishing.*

Authors’ reply

We would like to thank the reviewer for the accurate summary and for the general positive judgment about the study.
